                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Four types of regulatory chains are found: I-alpha, I-beta, II-alpha, and II-beta. Their expression varies among tissues and is in some cases constitutive and in others inducible.

Type Ir regulatory chains contain a high-affinity binding site for Mg-Arp.

The pseudophosphorylation site binds to the substrate-binding region of the catalytic chain but is not phosphorylated. The physiological significance of phosphorylations by other kinases is unclear.

TION **superfamily cAMP-dependent protein kinase regulatory chain; cAMP receptor protein cyclic nucleotide-binding domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               homology acetylated amino end; ATP binding; cAMP binding; duplication; heterotetramer; homodimer; phosphotransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sidues 1-381 ##label MAS
The inactive form of the enzyme is composed of two regulatory chains and two catalytic chains. Activation by cAMP produces two active catalytic monomers and a regulatory dimer that binds four
are expressed during neural and epidermal differentiation.
                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

1. PROC. NATL. ACAD. SCI. U.S.A. 85:3703-3707(1988).

1. SUBUNIT: THE INACTIVE FORM OF THE ENZYME IS COMPOSED OF TWO FREGULATORY CHAINS AND TWO CATALYTIC CHAINS. ACTIVATION BY CAMP PRODUCES TWO ACTIVE CATALYTIC CHAINS. ACTIVATION BY CAMP PRODUCES TWO ACTIVE CATALYTIC CHAINS. ACTIVATION BY CAMP C.C. THAT BINDS FOUR CAMP MOLECULES.

1. PATH BINDS FOUR CAMP MOLECULES.

2. I PRODUCES TWO ACTIVE CATALYTIC CHAIN BUT IS NOT PHOSPHORYLATED.

3. THE PHYSIOLOGICAL SIGNIFICANCE OF PHOSPHORYLATIONS BY OTHER KINASES IS UNCLEAR.

4. I TISSUE SPECIFICITY: FOUR TYPES OF REGULATORY CHAINS ARE FOUND:

5. I TALPHA, I -BBTA, II -ALPHA, AND II -BETA. THEIR EXPRESSION VARIES AMONG TISSUES AND IS IN SOME CASES CONSTITUTIVE AND IN OTHERS

MOL. BIOL. CELL 3:1279-1294(1992).

-I- FUNCTION: ESSENTIAL FOR THE CONTROL OF THE CELL CYCLE AT THE G2/M
(MITOSIS) TRANSITION. INTERACTS WHITH THE CDC2 AND CDK2 PROTEIN
KINASES TO FORM MPF. G2/M CYCLINS ACCUMULATE STEADILY DURING G2
AND ARE ABRUBPILY DESTROYED AT MITOSIS.

-I- SIMILARITY: TO OTHER CYCLINS. STRONGEST TO OTHER CYCLINS A.
                                                                                                                                                                    SEQUENCE FROM N.A.

10. Melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-182108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly pottent stimulators of HLA-A2+182 in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.

R Hold metalonema antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

T immunise animal against melanoma.

T immunogenic peptide is derived from cDNA25 (R84854), a melanoma antigen derivative of gpl00 (see R84855). The companies of the derivative of gpl00 (see R84855). The melanoma its derivatives (see R84200-R84211) are used in medicaments (vaccines) for the treatment or prevention (by immunization) of melanoma. Antibodies against melanoma-specific antigens and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state

( melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotides sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when sadiolabelled, they may be used to identify tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Claim 81, Fig 7A: 184pp; English.

Claim 81, Fig 7A: 184pp; English.

Claim 81, Fig 7A: 194pp. English.

Cipholo is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen coNA25 (see R84854). gpl00 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunisation from a sample, the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cDNA25; MART-1; melanoma antigen recognised by T-cell; gpl00 antigen derivative; melanoma; metastatic melanoma; tumour-associated antigen; immunogen; diagnosis; prognosis; Mammalian sp.

                                                                                                                                                                          Claim 81; Fig 5A, 184pp. English.

CDNAZ is a melanoma antigen (MART-1) which is recognized by
T-lymphocytes, and is a derivative of the melanocyte-melanoma-
specific antigen gp100 (see R84855). Antigen cDNAZ5 is a source
of immunogenic peptides (see R84199) which are optionally modified
(see R84200-R84211) to enhance their binding to a MHC molecule and
used in medicaments, especially vaccines, for the treatment or
prevention (by immunisation) of melanoma. Antibodies against cDNAZ
and its immunogenic peptides may be used in the detection and
isolation of the antigen from a sample, the detection of which is
sequence 661 AA;

The Figh. To straight of binding to streptavidin and are capable of binding to streptavidin and are capable of binding to streptavidin straight of binding to streptavidin blasmid pASK60-Strep was produced starting from pASK40 (Blotechnology 9, 273-278, 1991) using site-directed mutagenesis and pCR. The plasmid contains an improved set of unique restriction sites, including two sites located directly at the 3' end of the region coding for the OmpA signal peptide. The polylinker is followed by a DNA sequence coding for a streptavidin binding copying passing passing passing peptide. The plasmid pASK60-Strep is useful for the expression of polypeptides fused to a streptavidin binding peptide. The production of such fusion proteins can be specifically detected using a streptavidin-alkaline phosphatase conjugate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Cloning DNA fragment - from gene coding corticotropin-release factor bisclosure; Fig 2; 15pp; Japanese.

Total RNA was extracted from sheep hypothalamus. The mRNA fraction was reverse transcribed to CDNA. A cDNA library was constructed and screened with a probe based on amino acids 167-171 of the known CRF sequence. A cDNA clone which hypridised with the probe was itself cused to rescreen the library. A clone containing the entire coding region for CRF was identified. See also N40237 and N40451.
         Claim 1; Page 10-17; 17pp; Japanese.

This sequence represents a protein having urea amide lyase (URL) activity and is encoded by a DNA sequence which was isolated from a yeast belonging to the Candida genus. The DNA encoding this sequence maybe used in a recombinant plasmid to transform a microorganism, and URL may be isolated from the culture medium. This method allows production of URL of high purity. The URL prepared gives a high sensitivity in urea determination.

Rat phosphoinositide-specific phospholipase C-gamma-1 (EC-3.1.4.3) (R90583) is obtd. by expression in a transformed bacterial host of CDNA (T12292) encoding rat PLC-gamma-1 and DNA coding for an epitope tag (Glu-Glu-Phe) which is incorporated at the C-terminus of the recombinant PLC-gamma-1 to facilitate affinity purification. The recombinant PLC-gamma-1 is used to assay the inhibitory activity of
expression prods., or mutation(s)
Claim 44; Page 31; 51pp; English.
Cells transformed with the wild-type DCC gene can be used as model
systems to study cancer remission and drug therapy. DCC polypeptide
expression prods. may be used to reverse the neoplastic state.
X1615 represent an amino acid illegible in the specification, all
other Xs are encoded by stop codons.
                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Multimeric forms of inter-cellular adhesion mol. (ICAM) -
displaying enhanced binding of human rhinovirus and able to
reduce its infectivity
reduce its infectivity
Fig 1; Page 37; 70pp; English
Oligonucleotides Q55327-35 were used to create forms of
ICAM-1 (R48038) that facilitate cross-linking and
multimerization. The primers given in Q55336-39 were used to clone
ICAM(185)/AgG immunoadhesin fusion protein. ICA(453)/IgG fusion
(R48037) in encoded by sequence Q55340. Mutein Q55342, a mutated
form of Q55340, encodes tICAM(452) cysteine mutant terminated at
residue 452.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                     Human soluble inter-cellular adhesion molecule-1 - which inhibits lymphocyte function associated with LFA-1 and ICAM-1 interaction claim 2; Fig 1; 16pp; English.

SICAM can inhibit lymphocyte function associated with antigen LFA-1 and ICAM-1 interaction, useful in treating inflamation, graft rejection, and for LFA-1 expressing tumour cells. Can also inhibit infection by rhinovirus and Coxackie A virus, increase inhibit infection and reverse immune dysfunction due to excess sICAM-1.
                                                                                                                                                                                                                                                                                         ICAM-1; intercellular adhesion molecule-1; human rhinovirus; HRV; probe; primer; polymerase chain reaction; PCR; hybridation.

Inter-cellular adhesion molecule protein.
adhesion; transmembrane; anticoagulation; heparin; heparinoid;
proteoglycan; prostavasin; inflammatory; immunological; lymphocytes;
multiple sclerosis; biliary; cirrhosis; erythematosus; rheumatism;
infarct; carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Changing peptide reactivity via conjugation with a second peptide causes change in conformation of first peptide, pref. LFA-1 and LCAM-1 functional domain derived peptide(s)

Claim 14; Page 38-40; 64pp; English.

Functional domains derived from LFA-1 alpha subunit CD11a (R80107), LFA-1 beta subunit cD18 (R80107) and ICAM-1 CD43 (R80110) are used as the basis of short, synthetic peptides (R80109, R80110) are used modulate ICAM/LFA binding interaction. CD18 is obtd. from human Prepared to the period of the pumman control of the period of the period of the pumman human human prepared to the period of                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 44; DB 15; Length 531;

DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

The immunogenic peptide is derived from cDNA25 (R84854), a melanoma antigen derivative of gp100 (see R84855). The peptide and its derivative of gp100 (see R84855). The melanoma its derivatives (see R8400-R84211) are used in medicaments (vaccines) for the treatment or prevention (by immunogenic peptides against melanoma-specific antigens and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state

( melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of bliding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when radiolabelled, they may be used to identify tumour deposits. PIR encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and recognized and antibodies, used to detect, treat and recognized and antibodies, used to detect, treat and recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen contact of the melanoma-specific antigen contact of the contact of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, specifies antigen contact on prevention (by immunogenic peptides may be used in the detection and isolation immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative sequence 661 AA;

Example 8; Page 51; 148pp; English.
A melanoma-specific immunogen homologous with pMel-17 comprises one
or more CTL (cytotoxic immunogen homologous with pMel-17 comprises one
R82194 capable of eliciting a CTL response. The epitopes R82098-
R82108 are of particular interest. The immunogen can be used for
partial protection in mammals against melanoma peptides which are
homologous with pMel-17 are highly potent stimulators of HLA-A2+
CTLs in several cell lines and can be used in immunotherapy or
incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                     Claim 81: Fig 5A: 184pp; English.

CDNA2 is a melanoma antigen (MART-1) which is recognized by
T-lymphocytes, and is a derivative of the melanocyte-melanoma-
specific antigen gpl00 (see R84855). Antigen cDNA55 is a source
of immunogenic peptides (see R84199) which are optionally modified
(see R84200-R84211) to enhance their binding to a MHC molecule and
used in medicaments, especially vaccines, for the treatment or
prevention (by immunisation) of melanoma. Antibodies against cDNA2
and its immunogenic peptides may be used in the detection and
isolation of the antigen from a sample, the detection of which is
indicative of a disease state (melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               74-502-1995.

Claim 10; Page 59-62; 74pp; English.

The sequence represents the H. pylori CagC antigenic polypeptide. CagC is transcribed with the CagB antigen (see R95003) as a single transcribe. Detection of these proteins using antibodies, or detection of the DNA using specific probes or primers, can be used to diagnose H. pylori infection and to indicate predisposition to peptic ulcers or gastric carcinoma. The proteins and their fragments may be used in vaccines. Mutant H. pylori deficient in CagB (ATCC 55611) or CagC (ATCC 55612) are attenuated because they do not stimulate synthesis of interleukin-8 in epithelial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA coding delia-(L-alpha-amino-adipyl) L-cystinyl D-valine synthase - for improved productivity of cephalosporin antibiotics claim 1; Page 14-27; 69p; Dapanese.
The sequence (04823) is of a vector which includes the delta-(L-alpha-aminoadipyl)-L-cystinyl-D-valine synthase gene. This sequence was transformed into a host cell to express the ACVS product. The protein produced (R40227) was then used to manufacture Sequence 3639 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding Helicobacter pylori CagB and CagC antigenic polypeptide(s) - useful for diagnosing H. pylori infection and to indicate predisposition to peptic ulceration or gastric cancer.
                                                                                                                          CagC antigenic polypettid.
CagC antigen: infection; peptic ulcer; gastric carcinoma; antisense oligonucleotide; treatment; prevention; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Delta-(L-alpha-aminoadipyl)-L-cystinyl-D-valine synthase; ACVS; beta-lactam; antibiotic; transformed; cephalosporin; vector.

Disclosure; Page 19; 56pp; English.
The amino acid sequence codes for delta- (L-alpha-aminoadipyl)-L-cysteinyl-D-valine synthetase (ACVS). The prods. may be used for the enhanced expression (in vivo and in vitro) of mutant enzymes and fermentable or known and new beta- lactam antibiotics and their precursors, partic. antibiotics of the penam and cephem classes. See also R13754-R13756.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                            Gaps
homology have been identified, domains I, II and III. Within these domains several even more conserved elements can be distinguished. Since the enzyme synthesises a tripeptide, which most probably requires the activation of three amino acids, a role for these domains in the activation reactions seems likely. A fourth domain is thought to act as a thioesterase. The gene can be used to express the synthetase enzyme which can be used for the produ. Of new beta-lactam antibiotics.
                                                                                                                                                                                                                                                                                                                                                      ö

T Deta-lactam antibiotic cpds.

Claim 1; Page 20; 54pp; English.

C Claim 1; Page 20; 54pp; English.

C Mich was sequenced using the Sequences system 2.0. The protein sequence was deduced from the DNA. Three distinct regions of homology have been identified, domains 1; II and III. Within sequence was domains several even more conserved elements can be clastinguished. Since the enzyme synthesises a tripeptide, which most probably requires the activation of three amino acids, a role for these domains in the activation reactions seems likely.

C A fourth domain is thought to act as a thioesterase.

The gene can be used to express the synthetase enzyme which can be used for the prodn of new beta-lactam antibiotics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27-MAY-1994 (first entry)
Enzyme involved in eloosapentaenoic acid (EPA) synthesis.
EPA; eloosapentaenoic acid synthetase; drug; anticoagulant;
hypolipemic; hypoglycemic; antihypertensive; anticancer; pesticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene region mutation for use as vaccine.

Disclosure, Fig 3; 24pp; English.

The 28K gene does not have an essential function in the replication of the virus and mutations can be introduced into this region. The virus may also have a mutation in the 28K gene region. The virus can be used to prepare vaccines for protection of plas against pathogens. The protein is, to a low degree, homologous to the Us2 protein of HSV-1.

Example 9; Pages 293-307; 661pp; English.

Double stranded hepatitis GB virus (HGBV) DNA obtd. from HGBV

C infected tamarin plasma, using standard procedures, was used to prepare a lambda phage HGBV cDNA library. Clones were rescued from the lambda phage, searched against a sequence database and found to be unique HGBV sequences. The clones were then used to sasemble the sequences T00129/30 (GB contig A and B) Which encode the proteins R94345-7 (the 3 possible coding strand reading frames) and R82072, respectively. Reagents which comprise the HGBV C INA, or its protein prods. can be used for the diagnosis, therapy cor in a vaccine to prevent HGBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                         02-JUL_1996 (first entry)
Hepatitis GB virus (HGBV) clone GB contig A protein prod.
Hepatitis GB virus; HGBV, diagnosis; treatment; vaccine; reagents; non-A; non-B; non-C; non-D; non-E; clone; GB contig A; tamarin; infected plasma; lambda phage; cDNA library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Yeast proteasome with specific aminoacid sequence - has unique

PT proteolytic activity, used for decomposition and synthesis of PT protein
PS Claim 1; page 1; 26pp; Japanese.
CC The yeast proteasome has unique proteolytic activity and can
CC The yeast proteasome has unique proteolytic activity and can
CC De used in the synthesis and decomposition of protein.
